

Portfolio Case Study — AI Job Application Assistant

Project status

COMPLETED — VERSION 2 TESTED

Overview

Built and tested a reusable AI-assisted job-application analysis workflow comparing a job advert with a candidate CV.

Problem

Applicants can have substantial transferable experience while lacking exact technical skills. The assistant must identify both accurately without inventing experience.

Approach

Created Version 1, tested it against Mizuho's Data & AI Apprentice role, identified improvements, created Version 2 with explicit evidence/classification rules, then tested it against an AI Digital Growth Apprentice role.

Skills demonstrated

Prompt/workflow design; requirement mapping; evidence-based analysis; transferable-skills analysis; iterative improvement; testing; evaluation; responsible handling of uncertainty.

Learning

Useful AI output depends on clear rules, evidence boundaries and testing. The project also demonstrated the difference between AI learning and professional AI implementation.

Future development

Move from a prompt-only workflow toward a structured application using Python, data extraction, APIs and automation integrations.
